

Using X3D, H-Anim, and SCORM to Create Reusable, Interactive 3D Instruction

Ed Sims, Ph.D., CTO

Vcom3D, Inc.

eds@vcom3d.com

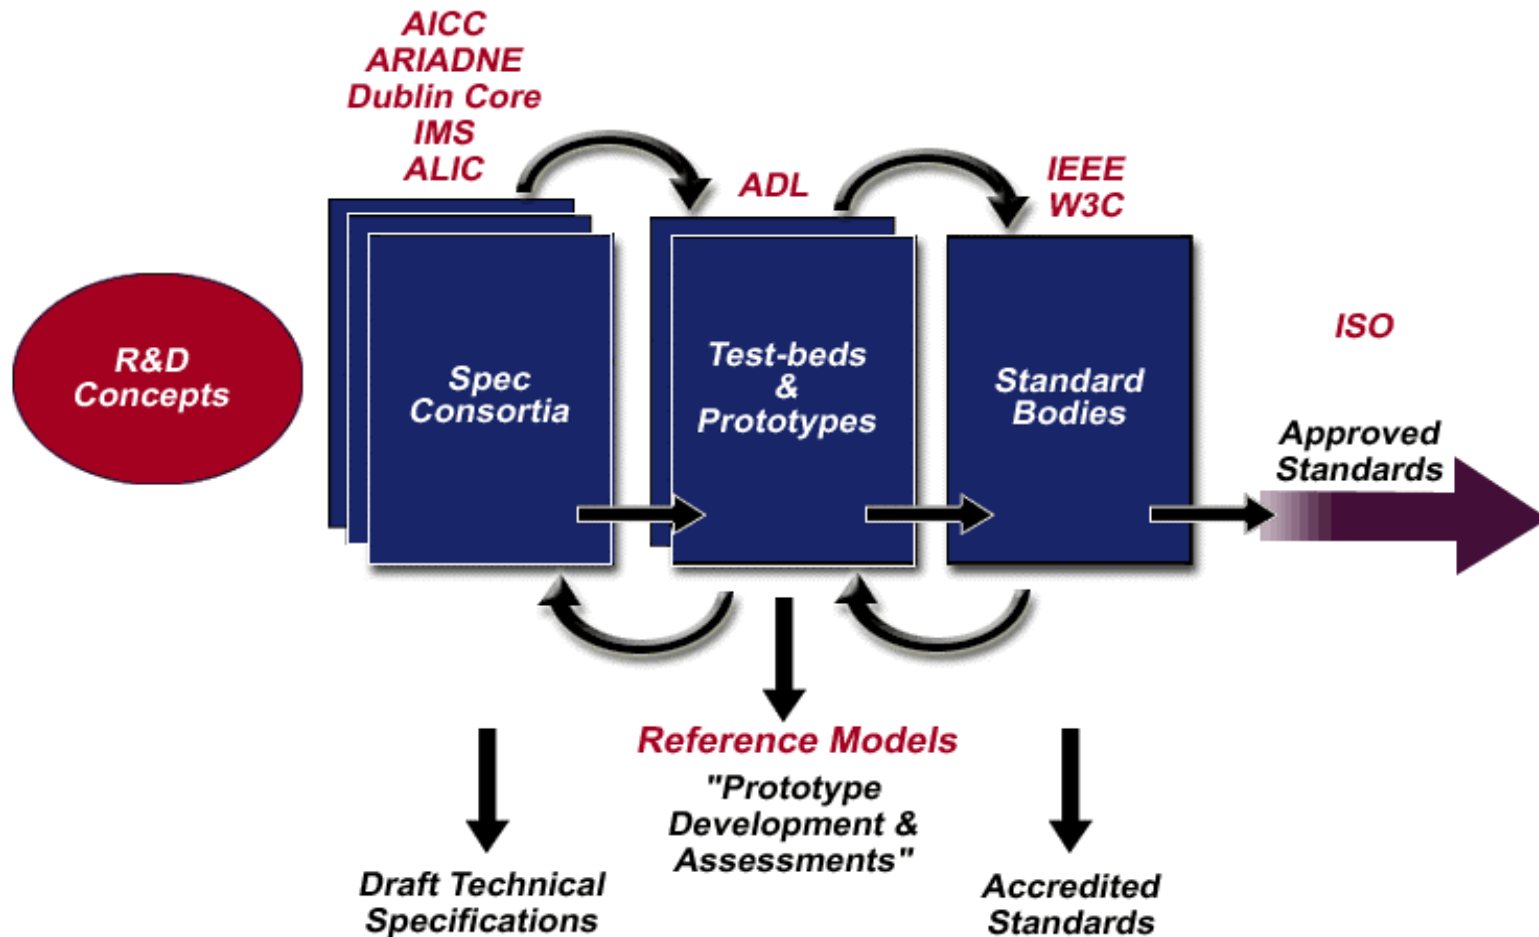

Agenda

- Advanced Distributed Learning
- Reusable Learning Objects
- Shareable Content Object Reference Model (SCORM)
- Shareable Simulation Assets
- An Approach to Creating Reusable Simulation Components

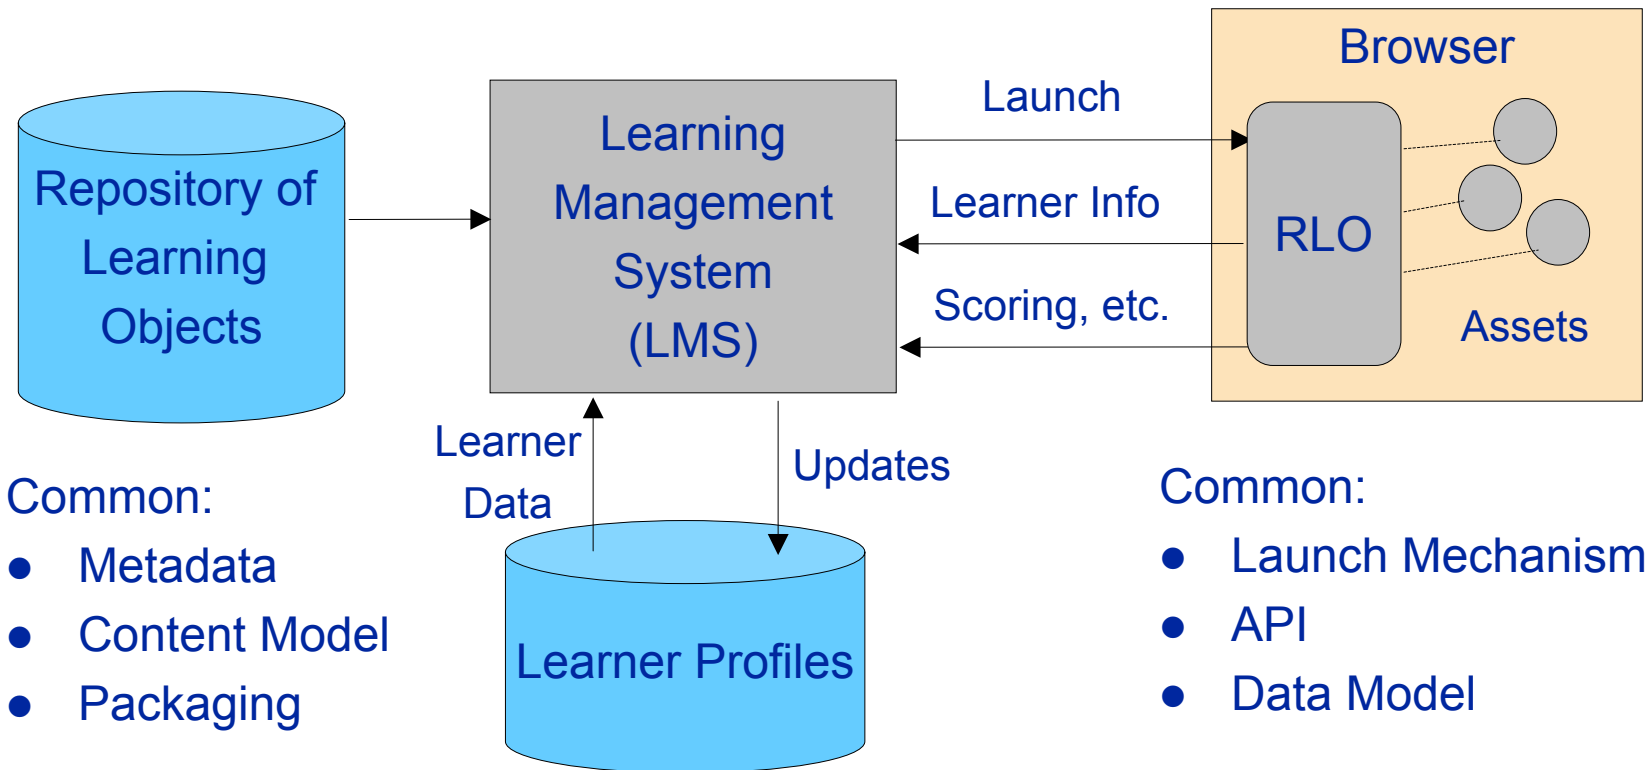

Advanced Distributed Learning (ADL)

- Advanced Distributed Learning is:
 - Learning that takes place anywhere and at any time it is required.
 - A term used to describe any of a number of initiatives aimed at promoting the accessibility, interoperability, reusability, and durability of instructional content.
- Consortia developing ADL specifications:
 - Instructional Management System (IMS) Global Learning *Int'l*
 - IEEE Learning Technology Standards Committee (LTSC) *Int'l*
 - Aviation Industry CBT Committee (AICC) *Int'l*
 - ARIADNE *EU*
 - PROMETEUS *EU*
 - ADL Initiative *US*

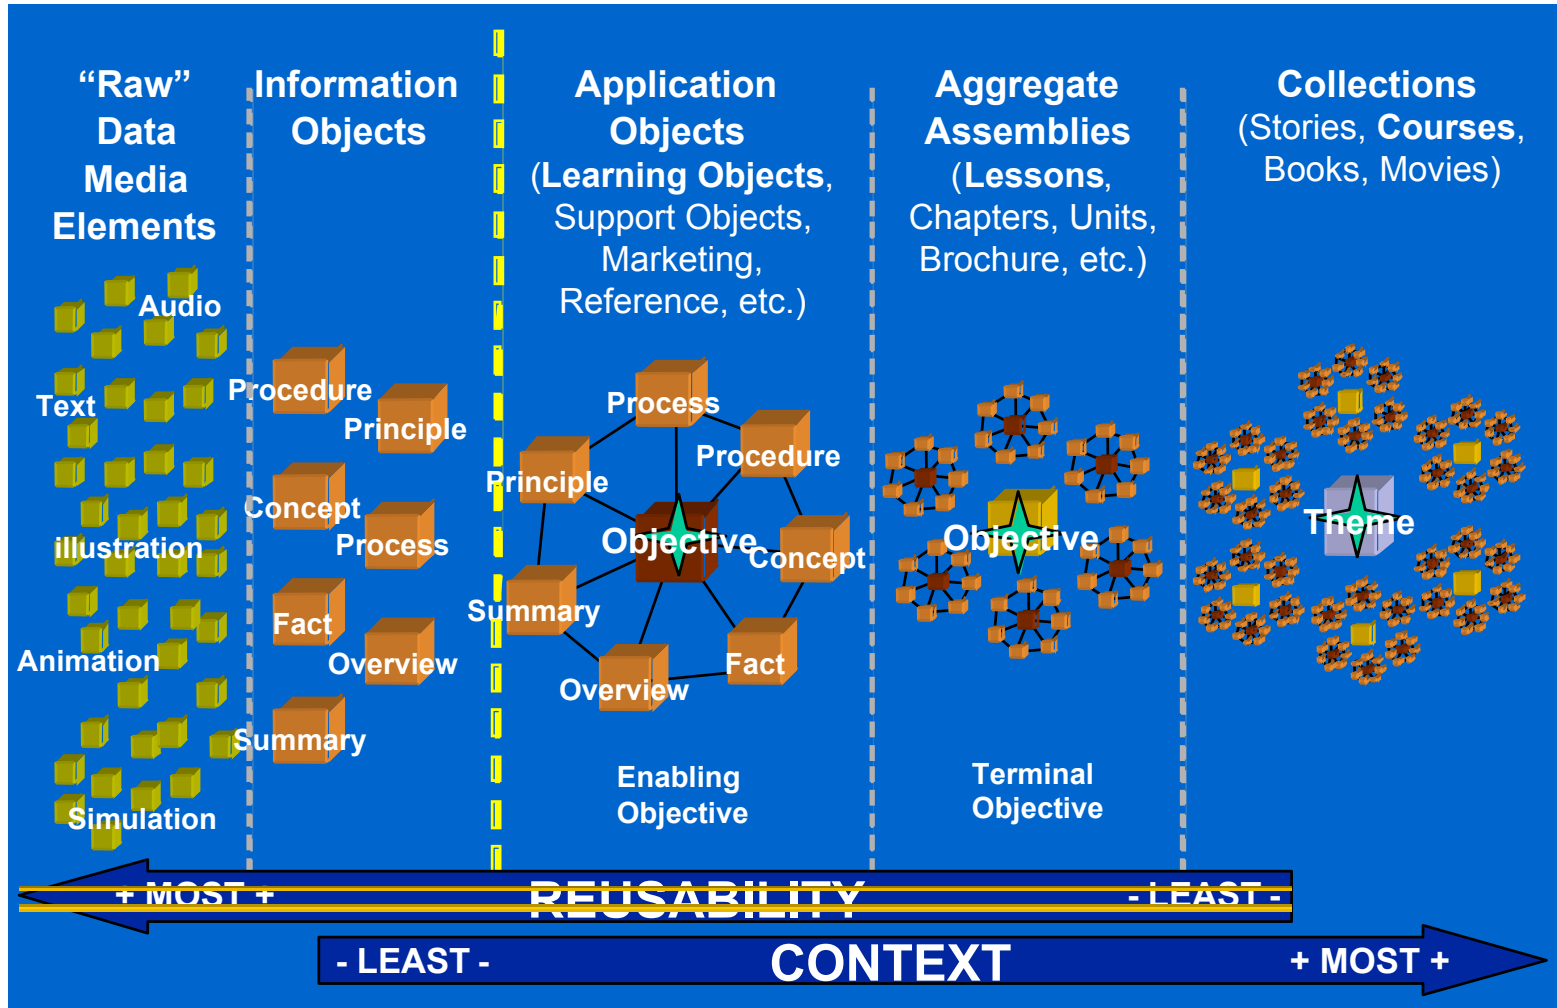

Relationship of ADL to Specification Consortia and Standards Bodies

Reusable Learning Objects

Instructional Content: Reusability and Context

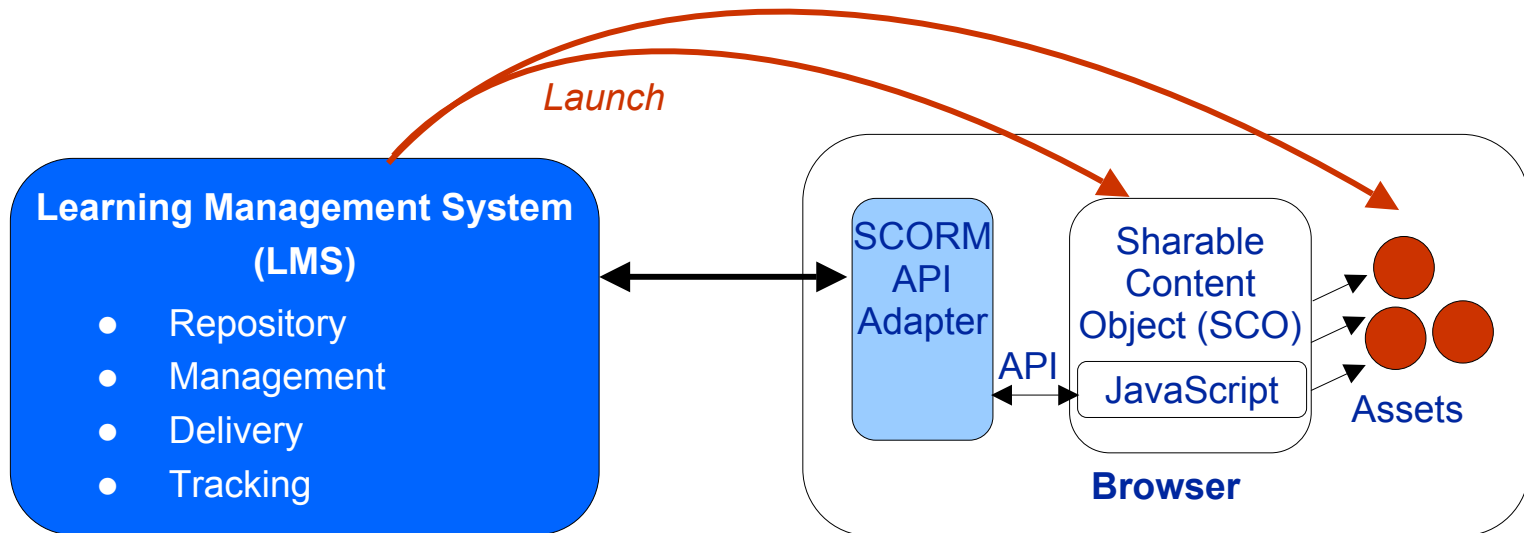

Source: Autodesk

Web-based Learning Content Issues

What problems are we trying to solve?

- Can't move a web-based course from one Learning Management System (server) to another
- Can't reuse web-based content pieces (objects) across different LMS systems
- Can't create searchable learning content libraries or media repositories

Sharable Content Object Reference Model (SCORM)

SCORM Run Time Environment

Data Model (from AICC)

Launch, Communication API (from AICC)

SCORM Content Aggregation Model

Meta-data Dictionary (from IEEE)

Content Packaging (from IMS)

Content Structure (derived from AICC)

Meta-data XML Binding and Best Practice (from IMS)

Sequencing and Navigation (IMS & ADL)

Source: Adpated from ADLNET.org

ADL “ilities”: Functional Requirements for Learning Objects Under ADL

- Learning content should have the following characteristics:
 - Accessibility
 - Interoperability
 - Reusability
 - Durability

SCORM Content Aggregation Model

- Content Model
 - Nomenclature defining the content components of a learning experience
- Meta-data
 - A mechanism for describing the components of the content model
- Content Packaging
 - Defines how to represent the intended behavior of a learning experience and package resources for movement between systems
- Sequencing and Navigation (Introduced in 2004)
 - Defines predictable, consistent ordering and delivery of learning activities

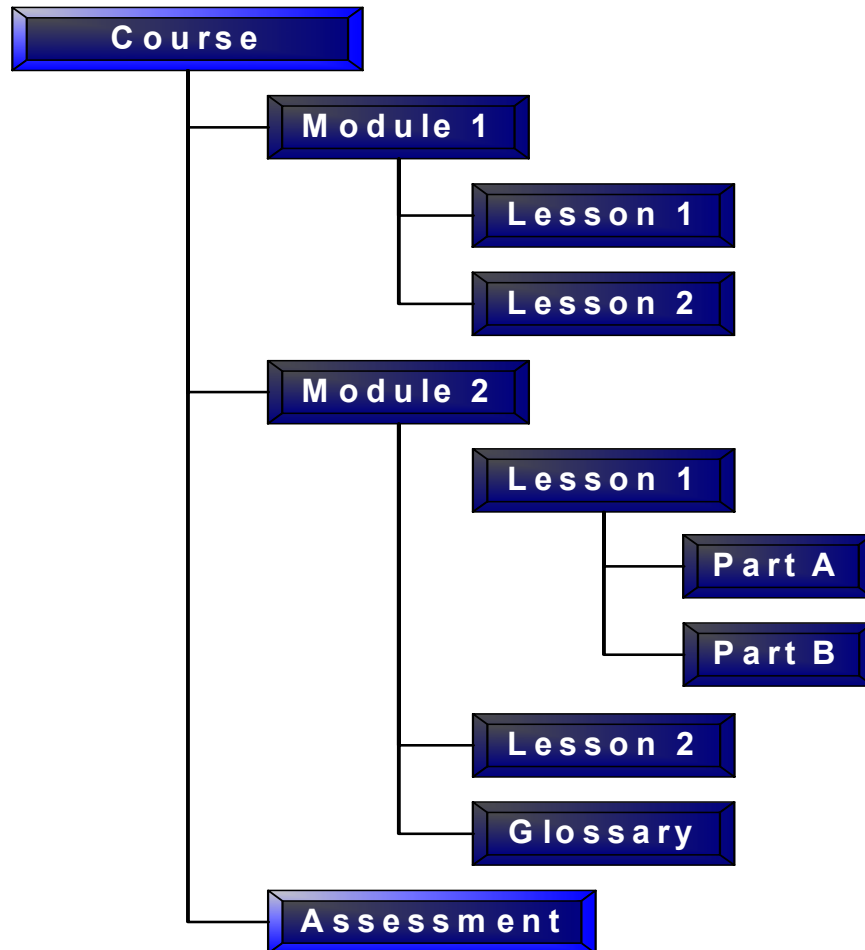

Shareable Content Components

- Asset
- Sharable Content Object (SCO)
- Content Aggregation

Introduced in SCORM 2004

- Sharable Content Asset (SCA)

Content Aggregation

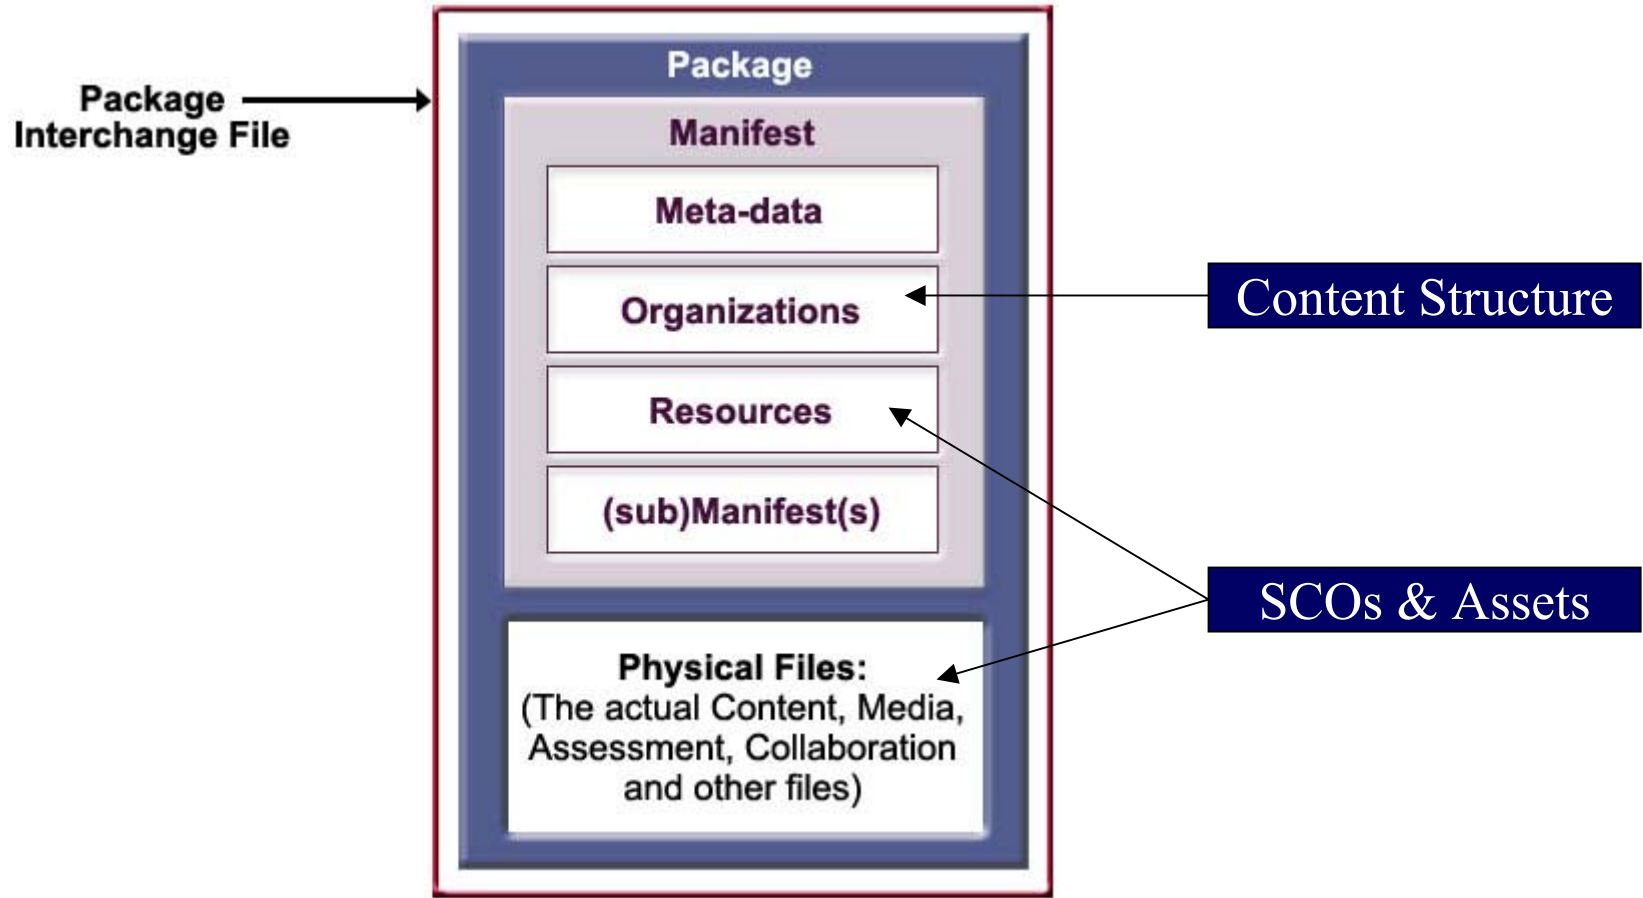

SCORM 2004 Metadata

- Directly references the IEEE 1484.12.1-2002 LTSC* Learning Object Meta-data (LOM) Standard
- SCORM defines which data elements are mandatory for describing:
 - Assets
 - SCOs
 - Content Aggregations
 - SCAs
 - Packages

Meta-data Information Model

- Describes the available data elements permitted to build SCORM conformant meta-data records
- Broken into nine categories based on definitions found in the LOM Information Model
 - General
 - Lifecycle
 - Meta-metadata
 - Technical
 - Educational
 - Rights
 - Relation
 - Annotation
 - Classification

Content Information Package

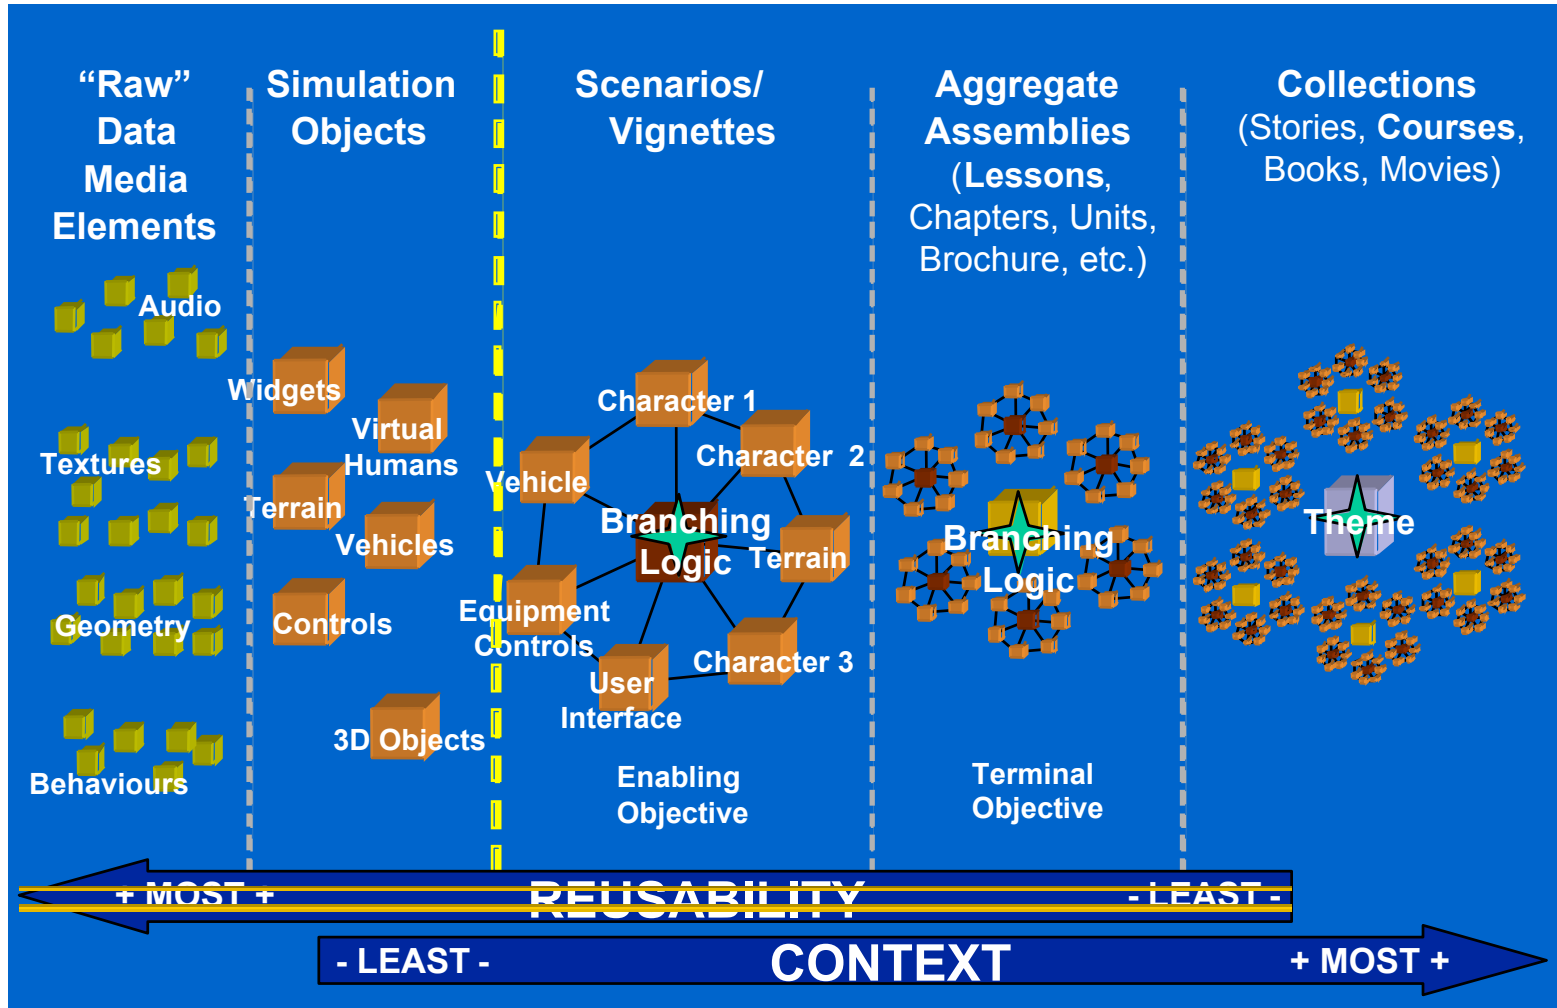

How do we extend this for Web3D?

- 3D Objects with Embedded Simulations as Assets
- Using Virtual Humans as Mentors and Role-playing Actors
- Example

Reusable 3D Simulation Objects

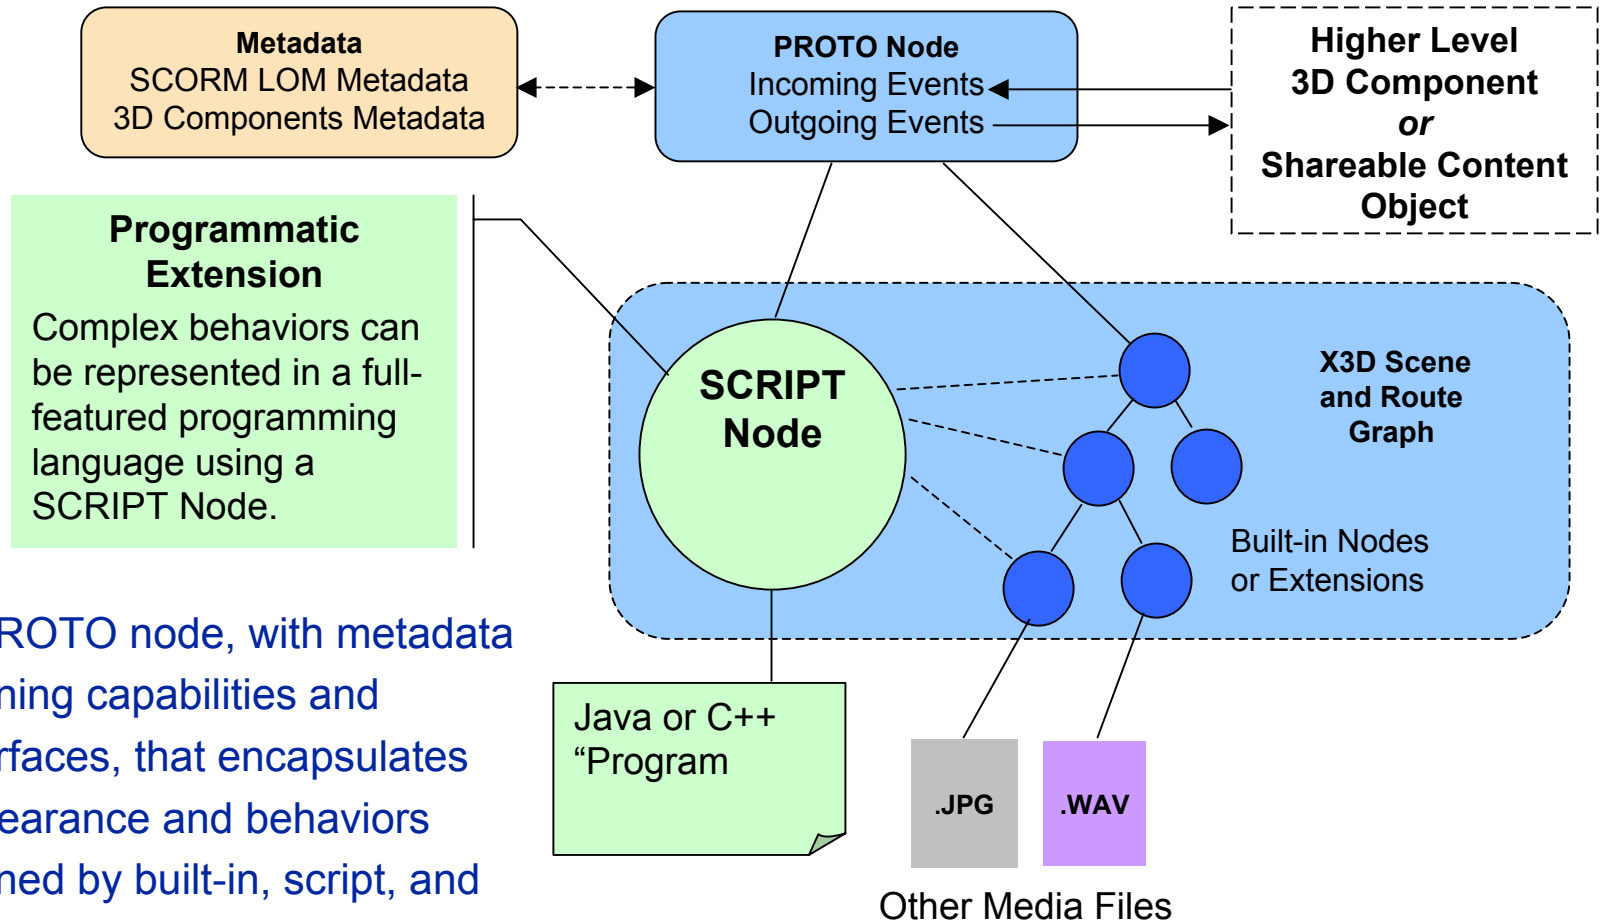

- In simulation-based e-Learning, a single, complex simulation object may cost more to develop than any of several Learning Objects that embed it.
- We wish to create 3D Simulation Objects that can be aggregated as SCORM assets, and re-used among many Shareable Content Objects.

Content Model for 3D Simulation Objects

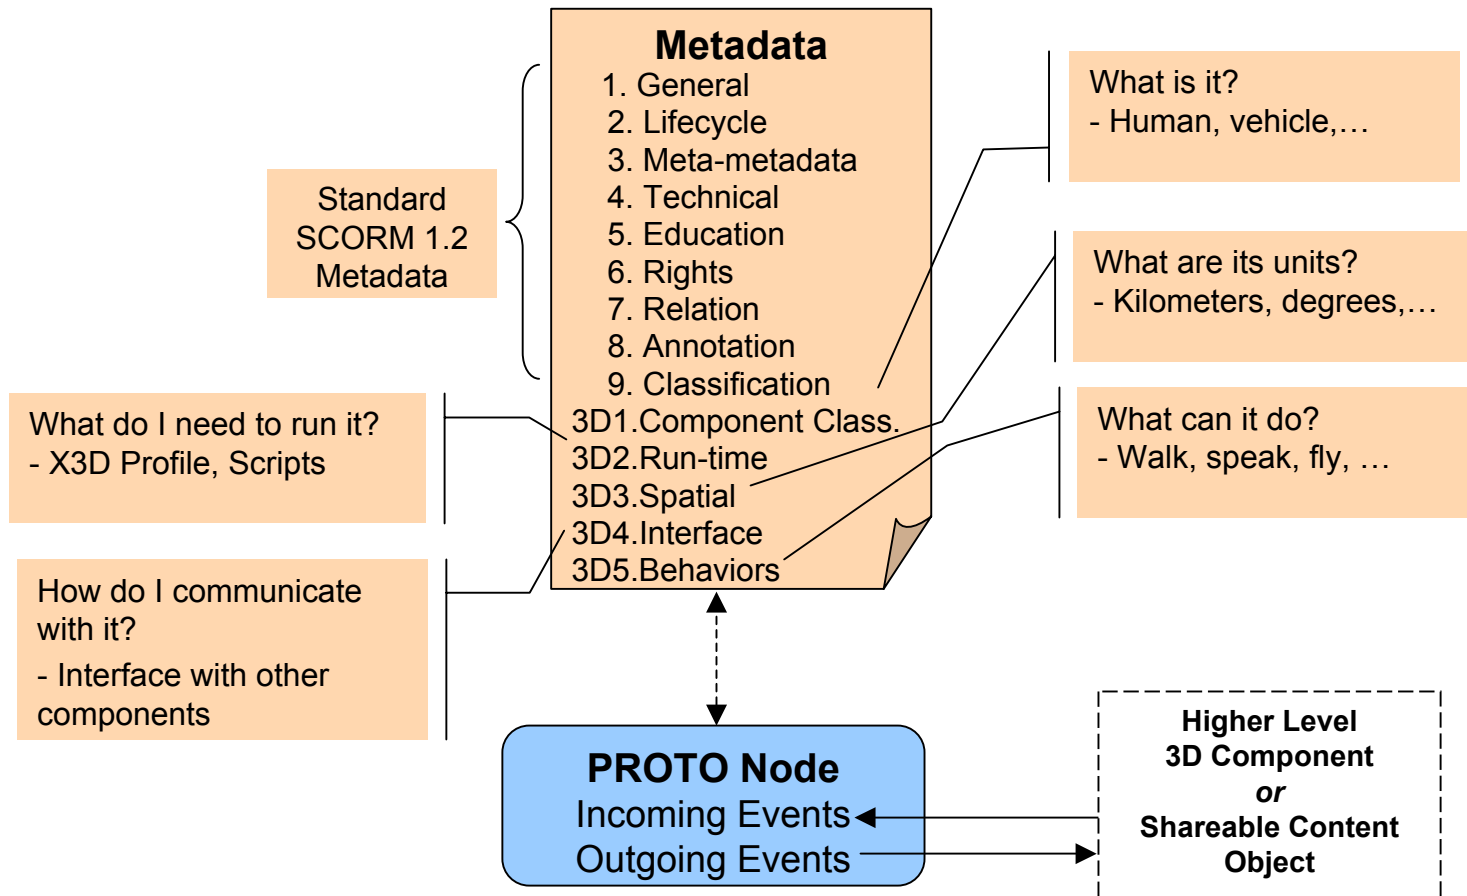

Adapted from: Autodesk

Implementation of 3D Components

A PROTO node, with metadata defining capabilities and interfaces, that encapsulates appearance and behaviors defined by built-in, script, and extension nodes.

Metadata for 3D Components

Interactive Multimedia Instruction

- Interactive Multimedia Instruction (IMI) is the most prevalent type of e-Learning today.
- Content (usually Web pages) sequencing may be linear, simple, or complex.

Level 1
(Linear)

Level 2
(Simple Branching)

Level 3
(Complex Branching)

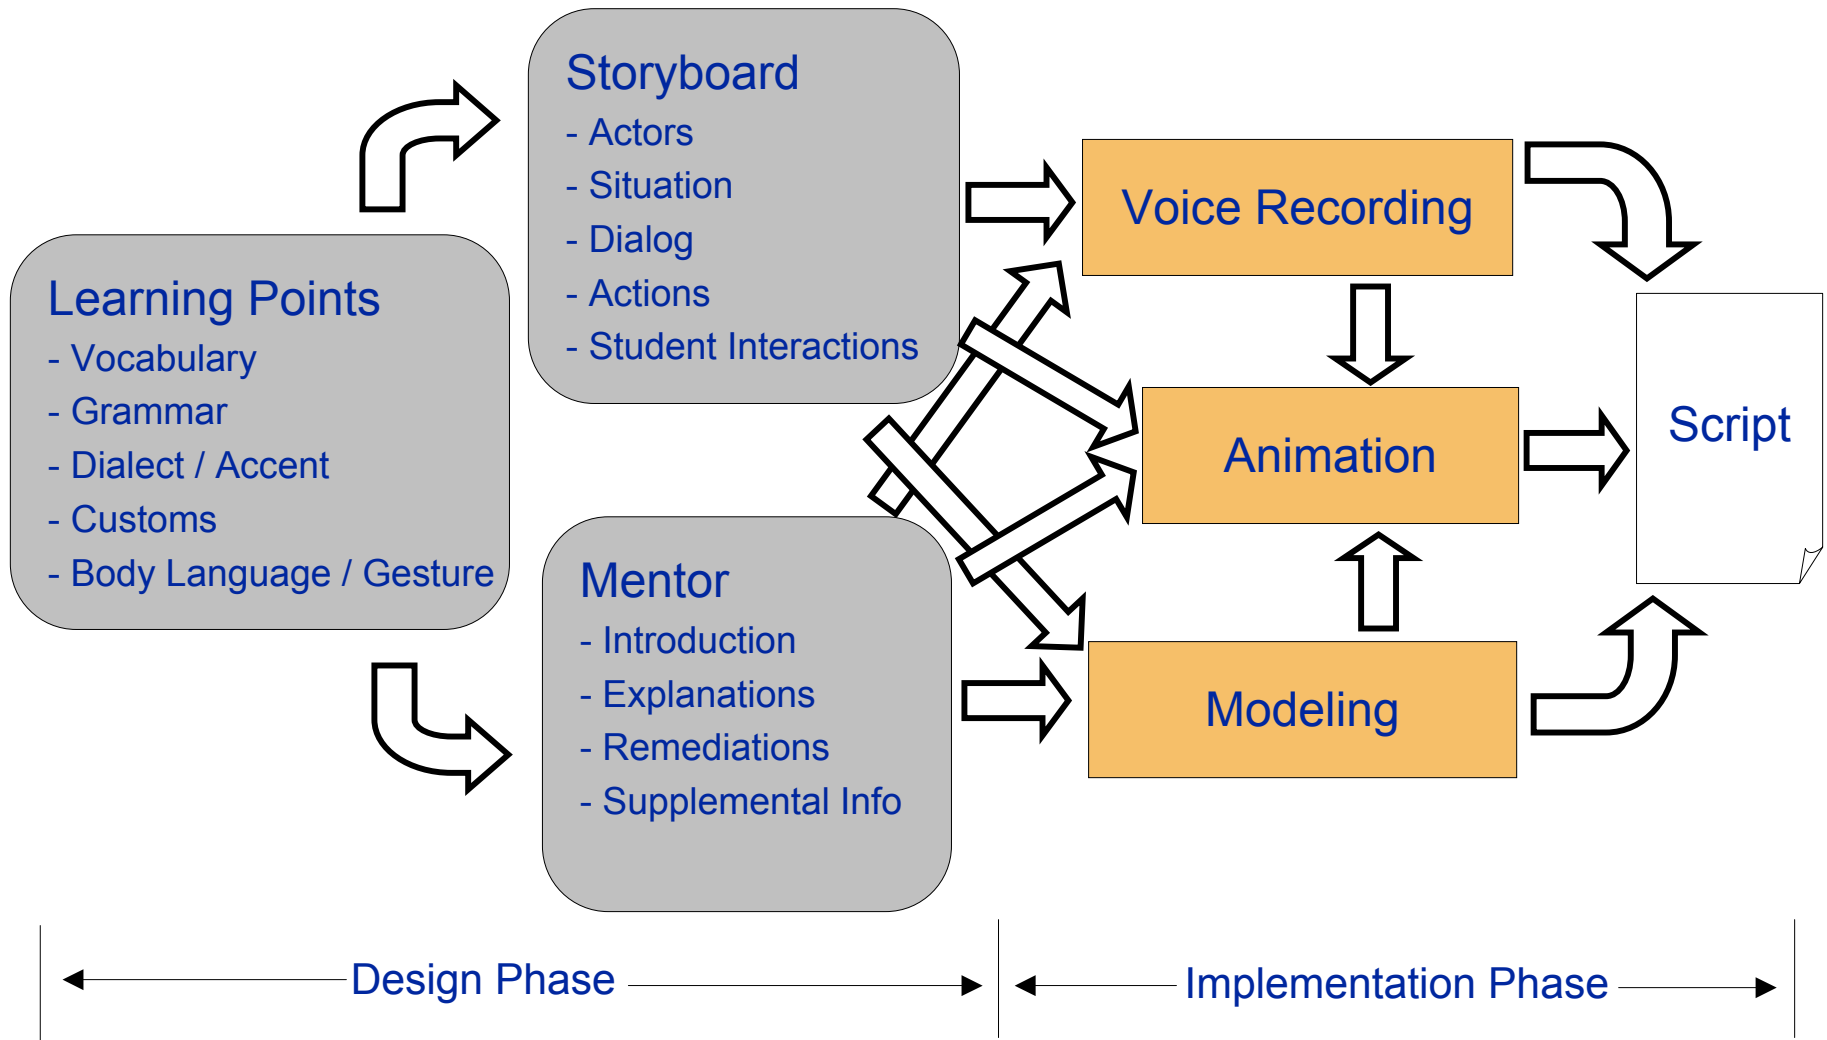

Using X3D in IMI

- Why use interactive 3D instead of video?
 - Lower bandwidth
 - Higher interactivity
 - Navigation and exploration
- Why use X3D?
 - XML syntax integrates easily with Learning Content Management Systems (LCMSs)
 - Significant content repositories available
 - Extensible to provide simulation APIs.

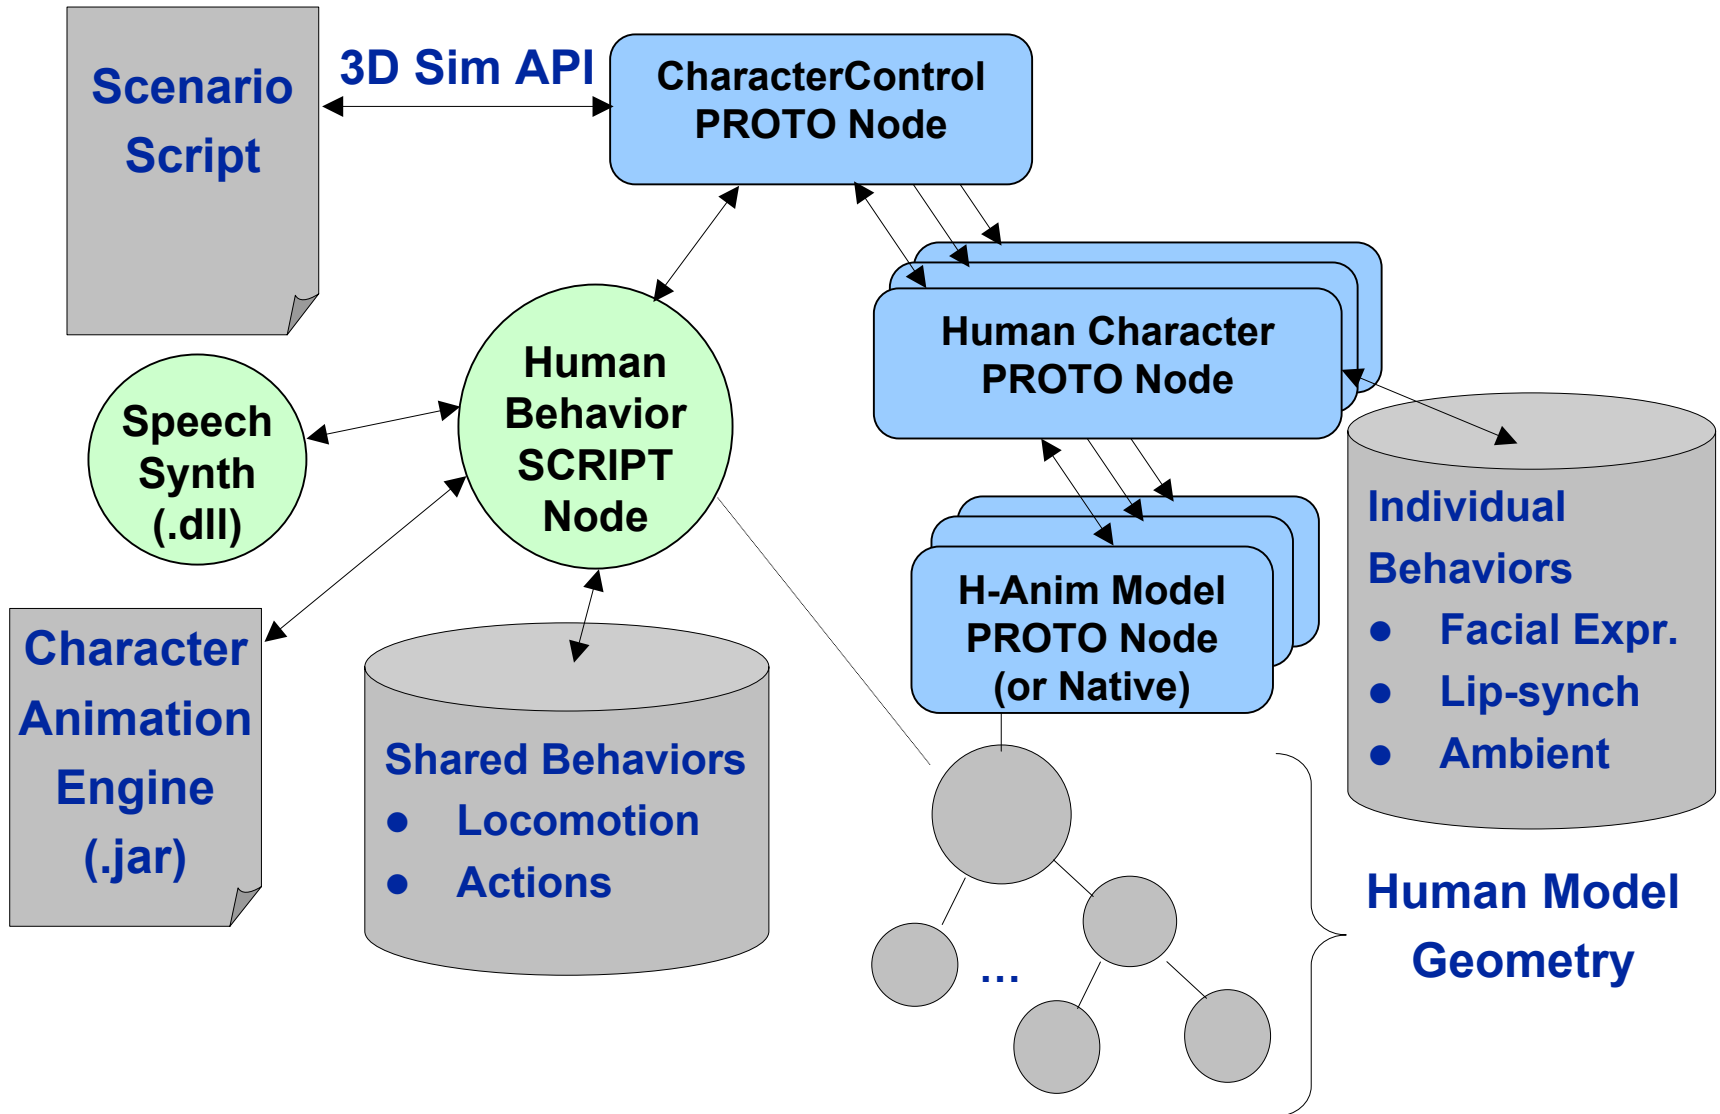

Using H-Anim in IMI

- Roles for Virtual Humans
 - Mentoring: More motivating than sound alone
 - Demonstrating: Can show complex procedures
 - Role-playing: Communication and human interaction skills
 - Interpreting: Sign-language
- Why use Animation?
 - Does not require live talent
 - Easy to edit
- Why use H-Anim?
 - Supports personalization and internationalization
 - Easy to upgrade models later

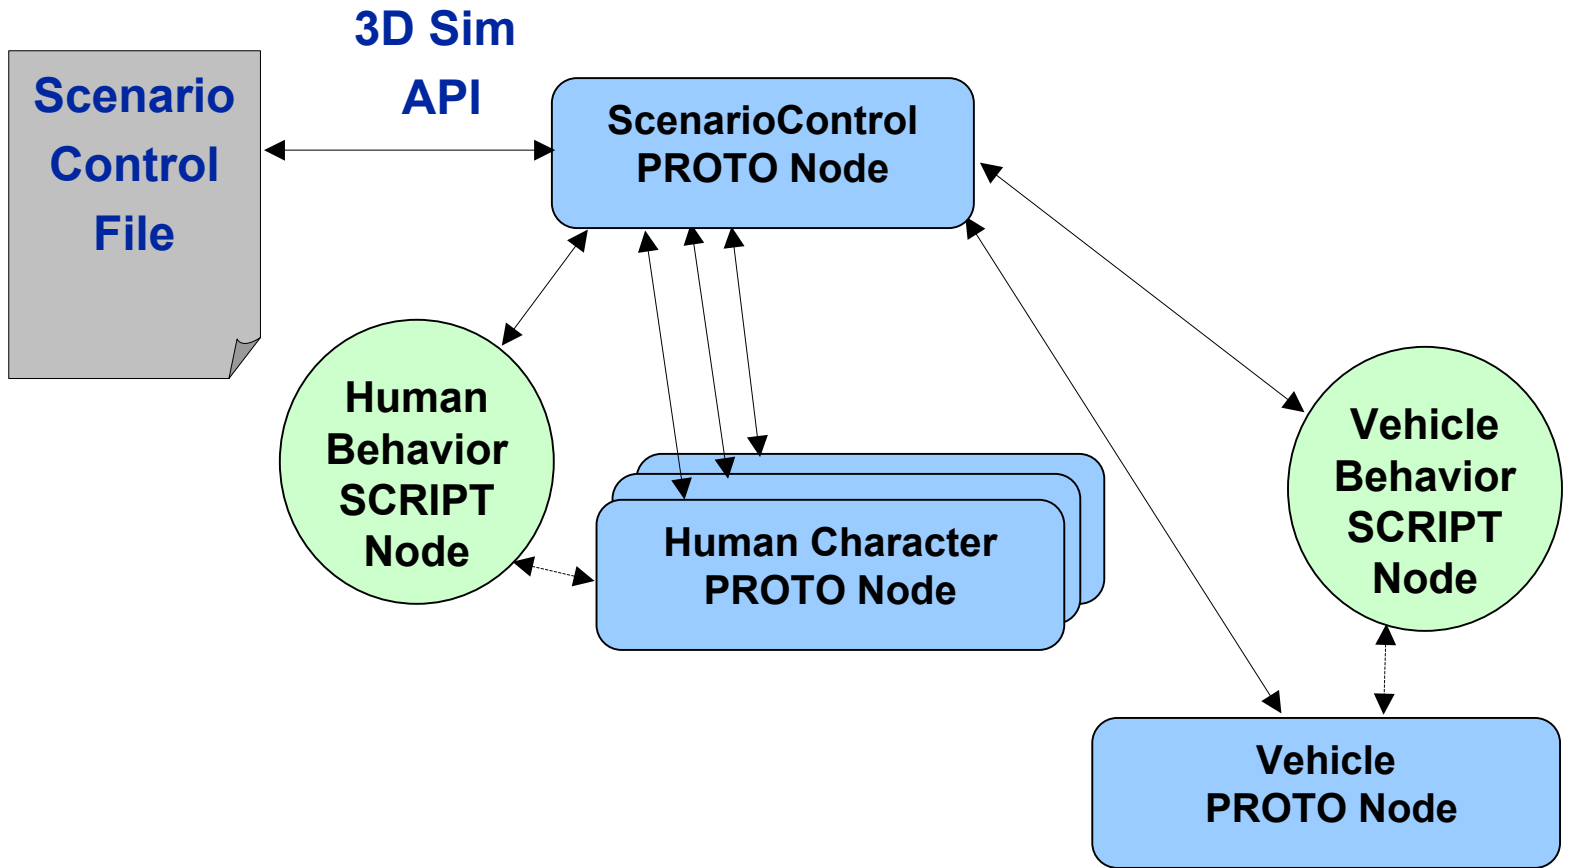

IMI Instruction Using Virtual Humans

Example 3D Component: Virtual Human

Scenario Control

SCL-Edit: IMI Authoring Tool

- Supports IMI Level 3-4 Course Design
- Uses Xeena: Same XML Editor as X3D-Edit

Toolbars

Native XML Editing

14 Node Types

Hierarchical View of Course Logic

Node Editor

The screenshot displays the 'acl.dtd Editor' window. The main area shows a hierarchical tree view of an XML document titled 'ACS C:/ADL/scenario/scenario.xml'. The tree structure includes:

- Root: <?xml version="1.0" encoding="UTF-8"?>
- Level 1: ACS AnimationControlSequence
- Level 2: Series (1.3.5)
- Level 3: Question (Q)
- Level 4: Goto (G)
- Level 5: Series (1.3.5)
- Level 6: Question (Q)
- Level 7: Interaction 1: Addressing a Group ...
- Level 8: Text (T) with properties: top: 438, left: 100, width: 824, height: 310
- Level 9: Arabic (A)
- Level 10: Phonetic (P)
- Level 11: ConcurrentEvent (C) with properties: object: Trish, field: animate
- Level 12: m1 1.25 h2.55 tp-0.85,1.21,3.33 all>point () {&mentor01.wav} roleshift_right
- Level 13: Choice (C)
- Level 14: Text (T)
- Level 15: Arabic (A)
- Level 16: Phonetic (P)
- Level 17: Text (T)

The 'Elements' pane on the left lists 14 node types: AnimationControlSequence, Arabic, CDATA, Choice, Comment, ConcurrentEv..., Copy, Goto, Head, Meta, Phonetic, Question, SequentialEvent, Series, and Text. The 'Node Editor' at the bottom shows a table for the selected 'Question' node:

| Attribute | Value |
|-----------|--------|
| id | <None> |
| idref | <None> |

Example: Checkpoint Scenario

- Developed by Vcom3D in partnership with the U.S. Defense Language Institute and Naval Postgraduate School.
- Teaches elements of Iraqi Culture, Customs, and Dialect.

Iraqi Checkpoint Scenario

- Family of four approaches checkpoint on road to Baghdad
- Student, playing the role of soldier, must properly interact with each family member to:
 - Get Background Information
 - Check IDs
 - Conduct Search
- Student's actions influence outcome
- Mentor acts as guide and provides remediation

Scenario Development Methodology

- Identify learning objectives.
 - “Hot points”, but subtle
- Map objects to context of checkpoint scenario.
- A priori write script/storyboard with “directions” (the cues, gestures, intonation, etc.)
- Videotape to verify and elaborate upon what was identified a priori.

Demo Caveats

- Work in progress
 - “Hot off-the-press”
- Rerecording narration
- Major role of mentor – scenario-specific
- Making other enhancements
- The real learners will have had approximately 2 semesters of Modern Standard Arabic language training at DLI

Demonstration

Video Recording

Non-Interactive

250KB / sec

3D Simulation

Interactive

5KB / sec
